

Cybersecurity

Cybersecurity is an essential task to consider whenever adopting a new technology. R&C Drone AgSpray takes this very seriously and does not use any equipment prohibited by the Federal Communications Commission 47 U.S.C. 1601. With growing tensions between the USA and China, we take extreme caution whenever we use something designed and manufactured in China. Unfortunately, a US-made option for a spray drone is not viable because, from our research, reliability, and productivity are miles behind the current offerings from DJI, the leader in drone technology. Our plan to maintain cybersecurity is not to take jobs where we would have proximity to crucial infrastructure or military installations. Another measure we are implementing to maintain security is not connecting the drones to the internet unless necessary. We also carefully read all terms and conditions we agree to before setting up and using any technology of Chinese origin. We are constantly looking for a US-based manufacturer and hope that more of them will arise in the industry and become the new leaders in this technology within the coming years.
