

Attachment F – Monitoring and Evaluation

From a connectivity standpoint, the key performance indicator is consistent and reliable delivery of speeds of at least 100 Mbps download and 20 Mbps to each farm site. Meeting this metric $\geq 99.9\%$ of the time, absent force majeure events, will be considered a successful outcome.

Vistabeam will provide these speeds immediately upon completion of the project and will monitor connectivity to the site 24 x 7 x 365 using the Tarana Cloud Suite, which provides cloud-based network monitoring and maintenance. See Attachment H_2 for additional information on the Tarana Cloud Suite.

The North Platte Natural Resources District will establish its own milestones and key performance indicators for the success of the image-based water monitoring systems and weather sensors.
